Intake system cleaning for diesel and petrol engines

**bluechemGROUP presents Triple X PLUS**

Leutenberg, August 04, 2016 – The international group of companies bluechemGROUP presents its laboratory’s own development for thorough cleaning of the intake system of petrol and diesel vehicles. Thanks to its highly effective formulation, the innovative product Triple X PLUS removes stubborn deposits in the engine from the intake system to the combustion chamber. Therefore, it prevents poor performance and ensures an optimal fuel economy as well as standards-compliant emission levels.

Since modern downsized direct-injection engines, which are equipped with turbocharger and exhaust gas recirculation, keep spreading more and more, there is a constant increase in vehicles that require air intake system cleaning. Despite all the advantages of this technology (adequate power, low emissions), it also leads to stubborn deposits (carbonization) that accumulate in the combustion chamber, in the intake system and partly in the exhaust system. For this problem, the bluechemGROUP has developed its own high-performance cleaner Triple X PLUS.

Alexander Bienek, product manager, explains: "Our new product is characterized by an extremely effective formula. It not only eliminates all operational deposits in the whole system, but it is also suitable for both diesel and petrol vehicles. After just one application, the engine performance is renewed, the fuel consumption is restored and the emission levels are optimal according to standards."

The bluechemGROUP recommends carrying out the cleaning with the Injection System & Air Intake System Cleaning Device Clear Flow and the corresponding S- or Flex Adapter.
